

AND/S AXIAL FLOW FANS with adjustable blades
As Standard fans and High Temp - Smoke Fans

ECOFIT
rosenberg 

Warranty Guidelines

The customer is responsible for the project design, selection and operation of the fans. The supplier gives warranty for faulty products, excluding further claims, in accordance with valid terms and conditions of business.

Warranty will not be given in the following instances:

(I) Unfitted or inappropriate usage, incorrect mounting or faulty installation by the purchaser or a third party, normal wear and tear, incorrect or negligent handling, improper maintenance, unsuitable operating material, unsuitable ground and chemical, electrochemical or electrical influence as long as they are not the responsibility of the supplier.

(II) If the goods delivered from the manufacturer are faulty, the customer has the right to receive a replacement or replacement of the faulty parts to the maximum value of the purchase price. The manufacturer also has the right to get the product repaired within a reasonable time period. The manufacturer must be informed immediately in the case of damage.

(III) The obligation to replace additional faults is herewith excluded. Our general terms of business are the basis for all further agreements for example: time periods to repair or replace. The general terms of business are available on our website www.rosenberg.eu or direct from one of our sales representatives.

The Rosenberg Group

Since the company's foundation in 1981, **Rosenberg Ventilation GmbH** has developed into an important centre for the heat, ventilation and air conditioning industry in Europe through the development and manufacturing of speed controllable external rotor motors, fans, blowers, air handling units, and motor speed control devices.

Our aim is for high quality production backed by our top class service for our clients. Thus a continuous flow of information and good cooperation between you, dear customers, and us is important to jointly achieve a continuous evolution of our products and their quality.

Modern test chambers and equipment, as well as computer controlled production handled by self-responsible working teams are part of our philosophy, as the control of high quality and environmental protection measures.

60% of Rosenberg's total revenue is in export sales. Currently Rosenberg has 240 employees at the company's headquarter in Kunzelsau and more than 1,400 worldwide. Further production facilities are located in Glaubitz(GER), Waldmunchen (GER), Hungary, Czech Republic, Slovakia France, Italy and China.

Headquarter in Kunzelsau, Germany

Axial fans ANS series with adjustable blades.

Technical Description

Axial fans with adjustable blades cover a wide capacity range due to their large variation possibilities with hub relation, number of blades and blade angle. With the Rosenberg ANS series, pressure increases up to 1200Pa and volumes up to 85,000cmh can be realized.

The allowed temperatures of the conveyed mediums are from -20°C up to +80°C as a standard, following description of motor manufacturer. Special motors for higher temperatures are available upon request.

The standard air flow direction is pressured over the motor. To reverse airflow direction, blade position must be rotated 180° and the direction of motor rotation must be changed.

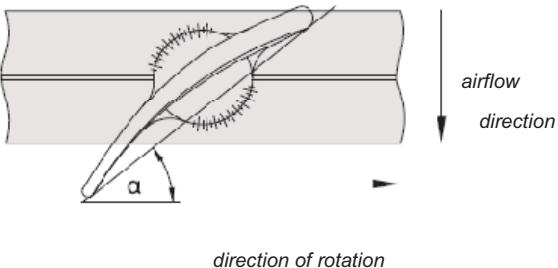

The fans are suitable for vertical and horizontal installation. The fans are designed for installation in a ventilation system and therefore supplied without protection guard as a standard.

Casings

The casings are manufactured from mild steel with hot dipped galvanized finishing after manufactured as an anti-corrosive measure and for longer life as a standard. Every casing comes with defined flange master gauge for holes to ensure an easy connection to the duct system. The centrally mounted motor is wired via a flexible weatherproof cable to an external located IP55 protected terminal box on the fan casing. The fan casing have a minimum thickness of 3mm on fan sizes up to 1120mm and a minimum of 4.5 mm for larger fans.

In the long casing version, the casing, the motor and the blades are covered. In the short casing version, the motor juts out. Two stage axial fans, coupling of two long casing fans are also available upon request.

Impellers

The axial impellers are balanced on quality level G 6.3 according to DIN ISO 1940. The hubs of chilled casting aluminium are made in two parts and have removal drilling for easy dismounting of the impellers. The profile blades are made of aluminium die cast. In standstill the blades angles are adjustable. If the blade angle α is adjusted after delivery, the power requirement must be checked for overload of the motor. The impeller has to be balanced after blade adjustment. The blade angle is measured on the wing tip. The number of blades is variable which expands the performance range and allows any operation. Aluminium alloy LM6M blades are used in smoke and fume extract up to 400°C.

Rosenberg supplies glass reinforced polypropylene blades for fan diameter 560 and below for normal class F motor as a standard. The blades are injection moulded UV stabilised anti-static, black color and with the same curve profile as the aluminium blades. Temperature range from -10°C to +80°C. The chemical resistance of polypropylene make the fans suitable to use in area exposed to some diluted acids and alkali, oily and with various organics such as alcohols, ketones aromatic and chlorinated environment.

Motors

3-phase IEC standard motors of type B3 with protection class IP55, insulation class F in 2-, 4-, 6- or 8 pole execution are used. Pole changeable, voltage controllable, invertor motors and single phase A.C. motors or higher airflow temperatures are available upon request. Motor used comply with electrical standard BS5000 and IEC publication 34-1, mechanical standard BS4999 and IEC publication 72.

Special Design:

Explosion Proof

ANS axial fans are available as explosion proof type. The maximum shaft power is limited to 15kW. The explosion proof fans are in accordance to ATEX standards with the marking II2GcIIBT3X. They are suitable for use in and for conveying in Zone 1 & 2. Exe or Exd explosion proof motor, depending on the application can be used.

Anti static FRP blades with aluminium hub are used for fan diameter 315 to 560mm as a standard. Aluminium impeller with anti-spark track are used for fan diameter 630mm and above. The aluminium anti-spark track isolate the steel casing from the blades, thus preventing the possibility of a static electric spark. Anti static FRP blades with aluminium hub for 630mm diameter and above are also available.

Due to the larger annular gap of explosion proof fans, a power loss (5% in volume flow and 15% in pressure) must be taken into consideration during selection.

Explosion proof fan with anti-static FRP blades.

Explosion proof fan with aluminum impeller and anti-spark track.

Smoke Extract

ANS axial fans are suitable for smoke extract system. Only aluminium impellers are used. Fan casings are made from mild steel with hot dipped galvanized finishing as standard. Special high temperature rated for 300°C two hours, on time continuous run, class H insulation, IP55 motors are used. For higher temperature range, please consult our sales representatives.

Epoxy Coating

Epoxy coating on casing is available on special request. The fans are painted with protective epoxy coating paints in situations where they are exposed to chemical solvents, saltwater and other corrosive atmospheric conditions.

Optional Features

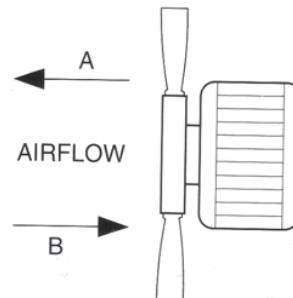

Reverse Direction

The standard direction of flow is Form B, where air passes through the impeller over the motor. Reverse flow, Form A can be provided on request (for 3 phase motor only). The resulting performances in reverse direction are:

Volume reduced by 30%.

Pressure reduced by 50%.

Power reduced by 25%.

Guide Vanes

Up stream or Down stream guide vanes can be incorporated to increase the fan performance.

Up stream (or inlet) guide vanes create a swirl effect in the the opposite direction to the impeller rotation. It enables the following fan performance increases:

Pressure 25%.

Volume flow 20%

Motor kw 40%.

Down stream (or Outlet) guide vanes act in the opposite direction to the swirl from the impeller and straighten the discharge air, enabling an improvement in pressure capacity:

Pressure 20%.

Volume flow 0%

Motor kw 0%.

Two-Stage

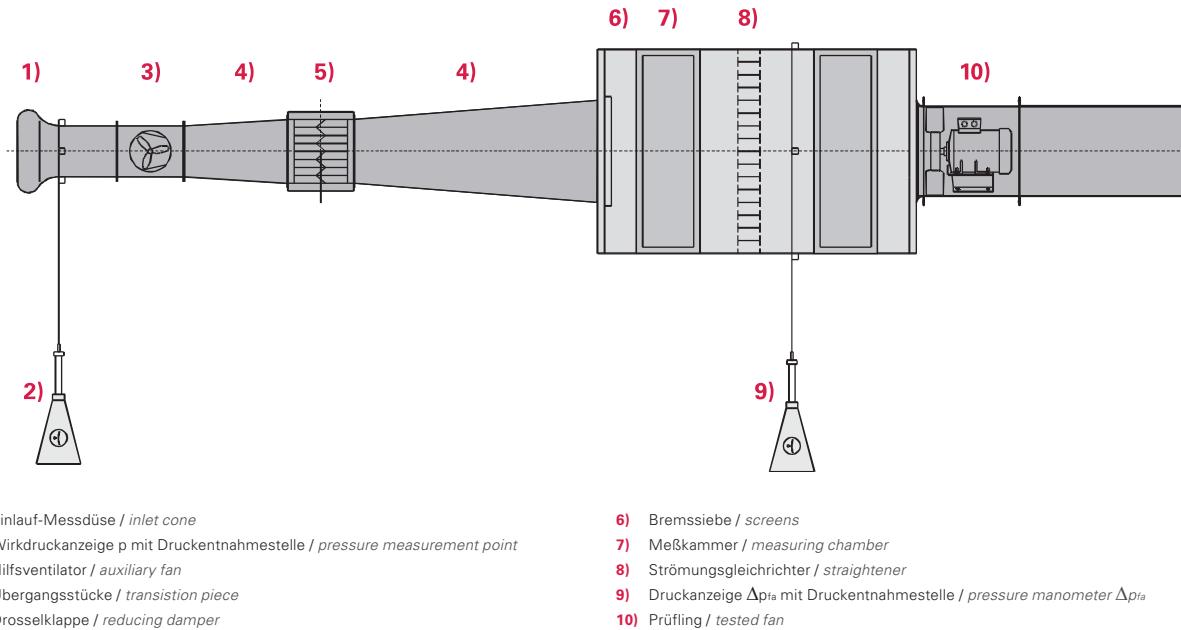

A contra-rotating two stage axial fan consists of two single stage oposite handed impellers rotating in oposed directions. The contra-rotating system develops approxiamately 2 to 3 times the static pressure of a single stage impeller system of the same diameter and speed. The two stage system uses 5 to 10% less power and is quieter than a single stage system producing the same work at the same diameter. The air flow can be regulated by idling one stage. A flow reduction of 35% and a power reduction of 50% is possible without losses.

If necessary more stages can be added if pressure demands are higher than a two stage system can meet.

Messverfahren für Luftleistungskennlinien

Die Luftleistungskennlinien wurden auf dem unten abgebildeten saugseitigen Kammerprüfstand entsprechend DIN 24163 Teil 1 bei Einbauart B aufgenommen. Die in diesem Katalog dargestellten Kennlinien zeigen die statische Druckerhöhung sowie den dynamischen Druck in Pascal (Pa) über dem Volumenstrom in m³/h. Die Kennlinien gelten für Luft mit einer Dichte von 1,2 kg/m³ bei einer Temperatur von 20 °C.

Saugseitiger Kammerprüfstand gemäß DIN 24163:

Geräuschmessung

Die Geräuschangaben erfolgen gemäß DIN 45635 Teil 38 bzw. VDI 3731. Angegeben wird für jeden Schaufelwinkel die A-bewertete Auslassschalleistung L_{WA6} in dB(A). Die Werte sind den unter den Kennlinienfeldern angeordneten Tabellen zu entnehmen. Der Messaufbau für die A-bewertete Auslassschalleistung L_{WA6} gemäß DIN 45635 Teil 38, Messgitter e, im reflexionsarmen Schallmessraum mit einer reflektierenden Ebene ist untenstehend aufgezeigt:

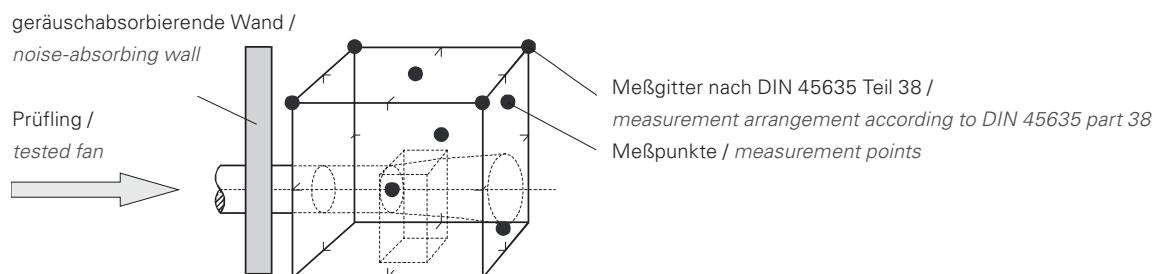

Measuring method for performance curves

Performance curves were made in accordance to DIN 24163 part 1 in mounting position B, using the inlet method in the test chamber as shown below. The performance curves in this catalogue show the static pressure increase and the dynamic pressure in Pascal (Pa) as a function of the air flow in m³/h. The performance curves are valid for air with a density of 1,2 kg/m³ with a temperature of 20 °C.

Inlet test chamber as per DIN 24163:

Noise level measurements

Noise specifications are in accordance to DIN 45635 Part 38 resp. VDI 3731. For each blade angle the A-weighted outlet sound power level L_{WA6} is mentioned in dB(A). The results please find in the tables below the performance curves. The measuring method for the A-weighted sound power level at the outlet side L_{WA6} according to DIN 45635, Part 38, graticule e, in a low-reflection sound measurement chamber with one reflecting plane is shown below:

Sound Level Information

The sound power levels shown on the fan curves are for inlet L_{wi} A scale for installation type D: ducted inlet, ducted outlet. Ratings include the effects of ducted end correction.

If the sound power frequency spectrum is needed, for example, the design of sound attenuators, the A-rated sound power levels at particular octave band frequency L_{WA} can be calculated by subtracting the relative sound level L_{wrel}.

$$L_{WA} = L_{wi} - L_{wrel}$$

The acoustic values of the inlet side can be used for the outlet side of the fans as well.

The sound pressure level at the inlet at 1m distance in low reflexion installation can be obtained by deducting 11dB from the sound power level at the inlet side. The sound pressure difference from 1m to distance a is obtained as follows:

$$L_p = 10 * \log (1/a).$$

Please note that reflections and room characteristics as well as natural frequencies influence the size of the sound pressure level differently.

Relative Sound Power Frequency Spectrum (L_{wrel}) [dB]

Fan Diameter (mm)	63 Hz	125 Hz	250 Hz	500 Hz	1000 Hz	2000 Hz	4000 Hz	8000 Hz

Summation of Sound Sources

Sound of several equal sources, can be added by

$$L_{\Sigma} = L_1 + 10 * \log (z)$$

whereby :

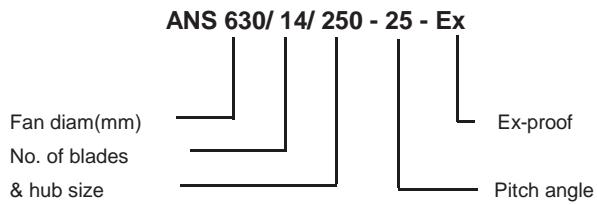

z = number of sources

L₁ = sound level of a single source

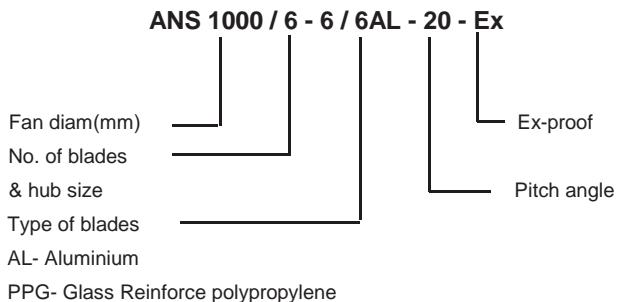

L_Σ = resulted level

Product Code Identification

Standard Range from 315 to 710

Larger Range from 800 to 1250

Fluid Flow Rules Of Operation For Fans

Speed variation at constant fan size and constant density :

The volume flow changes proportional to speed

$$V_1 / V_2 = n_1 / n_2$$

All pressures (static, dynamic and total) change square of the speed

$$p_1 / p_2 = (n_1 / n_2)^2 = (V_1 / V_2)^2$$

The power requirement changes cube to the speed

$$p_1 / p_2 = (n_1 / n_2)^3 = (V_1 / V_2)^3$$

Changes in the density at constant speed (or change of the kelvin temperature at a constant flow medium):

The volume flow is not affected

$$V = \text{const.}$$

All pressures change proportionately to the density *

$$p_1 / p_2 = \alpha_1 / \alpha_2 = T_2 / T_1$$

The power requirement changes proportionately to the density

$$P_1 / P_2 = \alpha_1 / \alpha_2 = T_2 / T_1$$

$$* T_1 = T_0 + t_1 = 273.15 \text{ K} + t_1$$

$$T_2 = T_0 + t_2 = 273.15 \text{ K} + t_2$$

In the case of changes in the wheel diameter of geometrically similar wheels at constant speed:

The volume flow changes cube to the wheel diameter

$$V_1 / V_2 = (D_1 / D_2)^3$$

All pressures (static, dynamic and total) change proportionately to the square of the wheel diameter

$$p_1 / p_2 = (D_1 / D_2)^2$$

The power requirement changes proportionately to the fifth power of the wheel diameter

$$P_1 / P_2 = (D_1 / D_2)^5$$
